

Variable og Faste Kostnader

Kostnader, klassifisering

Variable vs. Faste

- Variable kostnader varierer med mengden.
- Faste kostnader er den samme uavhengige av mengden.

Variable kostnader, $VC(Q)$

Variant	Variable kostnad (total) – $VC(Q)$	Marginal kostnad – $MC(Q)$
Underproporsjonale Konkav	 The graph shows a red curve starting at (0.5, 1.0) and increasing at a decreasing rate, passing through approximately (1.0, 1.5), (1.5, 1.8), (2.0, 2.1), and ending at (2.5, 2.4).	 The graph shows a red curve starting at (0.5, 1.0) and decreasing at a decreasing rate, passing through approximately (1.0, 0.8), (1.5, 0.6), (2.0, 0.5), and ending at (2.5, 0.4).
Proporsjonale Lineær	 The graph shows a red straight line starting at (0.5, 0.5) and increasing linearly to (2.5, 2.5).	 The graph shows a horizontal red line at $MC(Q) = 1.0$ across the entire range of Q from 0.5 to 2.5.
Overproporsjonale Konveks	 The graph shows a red curve starting at (0.5, 0.1) and increasing at an increasing rate, passing through approximately (1.0, 0.4), (1.5, 1.0), (2.0, 1.8), and ending at (2.5, 2.5).	 The graph shows a red straight line starting at (0.5, 0.5) and increasing linearly to (2.5, 2.5).

Faste kostnader

Variant	Faste kostnad – FC	Faste kostnad per styck
Faste		
Driftsavhengige		
Sprangvis Faste		

Total- og marginalkostnader

TC(Q): Totale kostnader som funksjon av mengden Q
(Eng. Total Cost as function of the Quantity)

$$TC(Q) = FC + VC(Q)$$

MC(Q): Marginalkostnader, grensekostnader

- (Eng. Marginal Cost)

- $MC(Q) = \frac{dTC}{dQ} \Rightarrow VC(Q) = \int_0^Q MC(q) dq$

Ekstra kostnad
for én enhet mer

Gjennomsnittskostnad

$AC(Q)$: Gjennomsnittskostnad
(Eng. Average Cost)

$$AC(Q) = TC(Q)/Q$$

AC^* : Minimal gjennomsnittskostnad

$$\frac{dAC}{dQ} = 0 = \frac{dTC/dQ}{Q} - \frac{TC}{Q^2} = \frac{1}{Q} \left(\frac{dTC}{dQ} - \frac{TC}{Q} \right)$$

MC

AC

Minimal Gjennomsnittskostnad

$$AC(Q_1) = TC(Q_1)/Q_1$$

Minimal Gjennomsnittskostnad
